Stage A: isolated workspace and data audit

FINAL_V1 - Parkinson's disease detection from speech

Protocol FINAL_V1 Status: **COMPLETED** Generated: 2026-10-20T09:37:09Z

What was done

- Created the isolated workspace /root/Projects/Project4a_FINAL_V1_ISOLATED and a clean Python environment; the original project /root/Projects/PatchTST was only read.
- Copied the raw corpus (838 files) read-only into the workspace; every SHA-256 matches the original.
- Archived historical plans, reports and code under Archive/previous_versions (copied, originals untouched); historical scores were not read or used.
- Isolation test passed: workspace distinct, 831 original audio files unchanged, original file list unchanged.

Data found

- Included: 785 recordings, 47 speakers (25 PD, 22 controls), 4.98 audio hours, 16 task codes pooled.
- Excluded: 45 young-control recordings (D-001) and 1 byte-identical duplicate (D-002). Three people recorded in two sessions were merged (D-003).
- Class prevalence: 53.2 percent PD by speaker.

Risks and blockers

- Every recording date holds one class only and all 44.1 kHz audio is PD: recording conditions are confounded with the label (resampling to 16 kHz applied).
- The prompt's frozen protocol file does not exist; a protocol was drafted (Stage B). FWL is blocked pending a protocol decision.
- No blocker prevents execution on this machine (32 CPU cores, 61 GB RAM, CPU only).

Table 1: Cohort used (included recordings and speakers)

Group	Speakers	Recordings
PD	25	436
Elderly controls	22	349
