Stage D: execution of the frozen experiments

FINAL_V1 - Parkinson's disease detection from speech

Protocol FINAL_V1 Status: **COMPLETED** Generated: 2026-10-20T13:06:52Z

Execution record

- 280 planned outer-fold runs; status counts: {'COMPLETED': 280}.
- 56 of 56 conditions have all five folds; FWL stayed BLOCKED (1 registry row).
- Every run passed six integrity gates (no speaker overlap, exactly one prediction per test sample, valid probabilities, labels, folds, hashes); no run failed and nothing was quarantined.
- Sum of per-run wall-clock times: 15.5 run-hours (runs executed in parallel, 09:42 to 11:48 UTC). Embedding extraction: three frozen encoders on CPU in parallel, 785 recordings each (4.98 audio hours), 09:39 to 10:41 UTC (about one hour of wall time).
- Only the frozen configuration was run: no search space, threshold, model or feature set was changed after the freeze. Execution-harness files (runner, aggregator, audit) were written after the freeze; modelling code is byte-identical to the frozen hashes.

Order of execution

- Acoustic runs (60) first, while the encoders were extracted; then wav2vec2, XLS-R, WavLM single-encoder runs (60); then the eight hybrids (160).

Table 1: Runs by representation

Representation	Planned runs	Completed	Runtime sum (s)
AC	60	60	1987
WLM	20	20	667
W2V	20	20	2350
XLSR	20	20	2217
H1	20	20	2039
H2	20	20	2197
H3	20	20	2285
H4	20	20	6987
H5	20	20	6928
H6	20	20	7772
H7	20	20	10994
H8	20	20	9434
