Stage E: independent audit

FINAL_V1 - Parkinson's disease detection from speech

Protocol FINAL_V1 Status: **COMPLETED** Generated: 2026-10-20T11:51:05Z

Result

- Out-of-fold leakage and integrity audit: ALL PASSED (20 checks, 280 completed runs, 0 failed, 56 conditions).
- Pooled AUROC and AUPRC of all 56 conditions were recomputed with independent code and agree with the reported tables to 1e-9.
- Isolation re-check at the end: workspace distinct from the original, 831 original audio files checked and 0 changed; original project file list changed since the start: no.
- What the audit cannot show: that the scores reflect disease. Recording date and class are confounded (see Stage A).

Table 1: Audit checks

#	Check	Status
1	Every speaker belongs to exactly one outer fold (all records of a speaker share the fold)	PASS
2	Speaker overlap between training and test in every completed outer-fold run is zero (recomputed from the froze	PASS
3	Each test sample has exactly one prediction in its run; ids equal the split manifest	PASS
4	True labels in prediction files equal the audited sample manifest	PASS
5	Probabilities are finite and in [0,1]	PASS
6	Folds in prediction files equal the frozen split manifest	PASS
7	Protocol hash and split-manifest hash in every run equal the frozen values	PASS
8	Threshold policy: predicted class equals probability ¿= 0.5 fixed in advance; no calibration or threshold sear	PASS
9	Run configurations on disk equal the configuration hashes stored in predictions and metrics	PASS
10	No byte-identical source audio appears in two outer folds; sample ids unique	PASS
11	No duplicated decoded audio among included recordings	PASS
12	Features and embeddings are joined by stable sample_id; shapes, finiteness, checkpoint revision and source-aud	PASS
13	Modelling code is unchanged since the freeze (hashes); only execution harness files were added after the freez	PASS
14	Preprocessing, tuning and feature-selection fit boundaries verified by the instrumented Stage C tests (T06, T0	PASS
15	Inner tuning logs exist for every run, train+test speakers equal 47, and selected hyperparameters belong to th	PASS
16	Feature-selection runs record exactly 10 selected acoustic features per fold	PASS
17	Every completed condition has exactly one OOF prediction for each of the 785 recordings (47 speakers)	PASS
18	Pooled speaker-level AUROC and AUPRC of every completed condition were recomputed with independent code and ag	PASS
19	Failed or quarantined runs	PASS
20	Registry statuses are consistent with the metric files	PASS
